/note="organ: testis_normal; Vector: pucl8; Site_1: SmaI; Site_2: SmaI; A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions.
                                                                                                                             This sequence was derived from the FAPESP/LICR Human Cancer Genome Project. Normalization and subtraction of cap-trapper-selected cDNAs to
prepare full-length cDNA libraries for rapid discovery of new genes
Genome Res. 10 (10), 1617-1630 (2000)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory In Riken Genomic Sciences Center and Genome Science Laboratory In RIKEN.

Division of Experimental Animal Research in Riken contributed to prepare mouse Lissues. First strand cDNA was primed with a primer [5' AGGAGAGGAAGGAAGCAAGACTTTTTTTTTTTTVN 3'), cDNA was and subsequently enriched for full-length by cap-trapper. cDNA went through two rounds of normalization to Rot = 20.0 and subtraction adapter of sequence [5'

The sequences given in AAR75197-98 represent rodent derived Gal-beta-1,3GalNAc,alpha-2,3-sialic acid transferase. The protein has characteristic features of a receptor having a substrate specificity of a glycolipid or a glycoprotein having a disaccharide Gal-beta-1,3-GalNAc at the terminal. The receptor substrate is pref. selective with sialic acid being taken up rather than glycolipid-disaccharide, in the presence of glycolipid, and successive uptake of sialic acid is in the order of GgA-GMI>GDlb in glycolipid. The transferase is used in the prevention of cancer metastasis, viral infection, anti-inflammatory, nerve cell stimulation, or stimulation of physiological activity by binding with
                                                                                                                             DNA encoding Gal-beta-1, 3GalNAc alpha-2,3-sialic acid transferase useful in prevention of cancer metastasis, viral infection, etc..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            204 rAlaLysAsn......LeuProAlaAsnValSerbheValL 216

Gal-beta-1,3GalNAC, alpha-2,3stalic acid transferase protein has characteristic features of a receptor having a substrate specificity of a glycopiotein having a disaccharide Gal-beta-1,3-GalNAC at the terminal. The receptor substrate is pref. selective with sialic acid being taken up rather than glycolipid-disaccharide, in the presence of glycolipid, and successive uptake of sialic acid is in the order of Gg4>GMI>GDID in glycolipid. The transferase is used in the order of Gg4>GMI>GDID in glycolipid, and in the presence of sialic acid is in the order of Gg4>GMI>GDID in glycolipid, and infection, anti-inflammatory, nerve cell stimulation, or stimulation of physiological activity by binding with

The sequences given in AAQ94307-08 represent active fragments of rodent derived Gal-beta-1,3GalNAc,alpha-2,3-sialic acid transferase. The active fragments are linked to heterologous N-terminal sequences. The Gal-beta-1,3GalNAc,alpha-2,3-sialic acid transferase protein has characteristic features of a receptor having a substrate specificity of a glycophorotein having a disaccharide Gal-beta-1,3-GalNAc at the terminal. The receptor substrate is pref. selective with sialic acid being taken up rather than glycolipid-disaccharide, in the presence of glycolipid, and successive uptake of sialic acid is in the order of Gg4>GMI>GDi in glycolipid. The transferase is used in the prevention of cancer metastasis, viral infection, anti-inflammatory, nerve cell similation, or stimulation of physiological activity by binding with

                                                                                                                                                                                                                                                                                         This sequence represents the human alpha2-3 stalate transferase. The invention relates to a method for the preparation of stalate transferase. In the method, E. coli is transferamed with an expression vector containing a stalate transferase gene and a maltose-combined protein gene, the transformant is cultured to form stalate transferase, and stalate transferase is collected from the culture. The method can express stalate transferase as an active soluble protein and can prepare alpha2-6 stalate transferase easily and efficiently in a large amount.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 528

Human ST3N is human Ga 1 beta 1,3(4)G lcNAc alpha 2,3 stalyltransferase. Human ST3N enzyme is quite similar to rat enzyme which has been found to preferentially act on type 1 chain (Gal beta 1,3 GlcNAc), but which can also catalyse the sialylation of type 2 chain (Gal beta 1,4 GlcNAc), albeit with lower catalytic efficiency. Note: AAR65242 contains 20 AAS less than would be predicted from the translation of AAQ82871, suggesting a possible error in the published patent specification.
                                                                                                                                                                                                                                                                                                                                                                                                                     seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-emb1/AA1995.DAT:AAR65242

                                                                                                         AAQ73117 encodes AAR62808 alpha 2, 3-sialyl transferase (AST). AST can be used in the preparation of a sugar chain having a useful physiological activity, such as a sialyl-Lewis-A or X, and their modified products.
                                                                                                                                     Alpha 2,3'-sialyl transferase and DNA encoding it - useful for prepn. of e.g. sialyl-Lewis-A or -x sugar chains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         102 PheSerLysProAlaProMetPheLeuAspAspSerPheArgLysTrpAl 118

```
content of N-acetyllactosamine repeated structure in the sugar chain of
a glycoprotein or a glycolipid produced by a cell. The intracellular
expression of the silatet transferase gene is increased, and the
relative activity of Siar to the activity of beta-1,3-N-acetylglucosamine
transferase (iGnT) is increased.
